

Claude Fable 5 Made This Entire Video By Itself

<https://youtu.be/ONmaDdOBGig>

What it's about

- Guy made a full YouTube video (script, AI voice, AI avatar, editing, motion graphics) using one prompt to Claude, no human editing.
- New model at the time: Claude Fable 5. Strong at coding, vision, and staying focused over long tasks.
- Tools used together: Claude for writing/orchestrating, ElevenLabs for voice, HeyGen for the AI avatar video, FFmpeg for stitching clips.

Not directly useful for SEO work

- This one's more "look what's possible" than a repeatable SEO process.
- Relevant takeaway: Claude can run long, multi-step jobs on its own if you give it a clear goal and tell it to verify its own work before stopping.

Fully Automated SEO with Claude Code (Rank #1 in 24 Hours)

<https://youtu.be/Yp0XCcr0OCU>

What it's about

Using Claude Code to replace an SEO agency and a content team: keyword research, content plans, writing articles, and posting to social media, all automated.

Setup

- Use Claude Code (desktop app or VS Code) — paid plan recommended.
- Build a reusable "skill" in Claude: give it a prompt once describing the SEO process, save it, then just say "run [skill name]" any time after.

The SEO skill, step by step

- Give it a website URL (yours or a client's).
- It crawls the site, reads the brand voice and existing content.
- It checks competitor content and finds gaps.
- It builds a content plan: topic clusters, priorities, keyword list.
- You approve the plan (or narrow it down).
- It does SERP research and builds a full outline per article (title, H2s, H3s, target keyword).
- It writes the actual articles.

Publishing options

- Manual: copy the articles out of Claude, paste into your site, add images/alt text/internal links yourself.
- Automated: connect an API (he uses a tool called Arvo/Arvel) so Claude publishes straight to the website with SEO fields (meta description, alt text, internal/external links) filled in automatically.

Bonus: social media on autopilot

- Second skill: pulls your blog's RSS feed and turns each post into social captions (Instagram, Facebook, LinkedIn).
- Pair with a scheduling tool (he uses Blotato) to auto-generate images/infographics/slideshows and schedule posts for the month.
- Can also generate simple videos from blog posts using a tool called Remotion, no manual editing.

Plan to try this for the ServiceOP client

- Set up one Claude skill: "crawl site, find competitor gaps, build a content + keyword plan, write SEO articles."
- Run it on the client's GBP website once to get a content backlog (weeks of articles in one pass).
- Manually publish the first few to control quality, then decide if an auto-publish integration is worth adding later.
- Optional add-on later: a second skill that turns each new blog post into GBP posts / social captions automatically.

This NEW Claude AI SEO Workflow is CRAZY!

<https://youtu.be/pYGxjMHqZQ>

What it's about

A 4-step Claude workflow for SEO: keyword research, topic clusters, EAT-optimized content, and local SEO pages — plus using it to fix content that's already ranking but stuck.

Step 1 — Keyword research

- Prompt: "Analyze the [niche] for SEO. Identify top keywords, search intent, competitor gaps, and winnable opportunities."
- Claude finds real, winnable keywords instead of dumping a huge generic list.

Step 2 — Topic clusters

- Don't write one article and hope — build a cluster: one main "pillar" article plus several supporting articles that all link back to it.
- This signals to Google that the site owns the topic (i.e. is the authority), not just one lucky post.

Step 3 — EAT-optimized content

- EAT = Experience, Expertise, Authoritativeness, Trustworthiness — Google's ranking factors.
- Ask Claude for content that includes real examples, data/stats, proper heading structure, author bio, and specific real tools/companies (not vague filler).
- Important: don't just copy-paste what Claude writes — add real experience/examples on top, that's what actually makes it rank.

Step 4 — Local SEO pages + iteration

- For multi-location businesses (like this GBP work), Claude can generate a unique page per city/location, each with local keywords.
- Feed Claude your Google Search Console data. If an article is stuck on page 2, ask it to rewrite the intro, add examples, and optimize for featured snippets — then republish.
- Also useful: give Claude a competitor's article URL and ask what they're missing (case studies, ROI numbers, etc.) so you can write something more useful.

Extra: structured data

Ask Claude to write structured data (schema) code for a page — helps you show up as rich snippets/FAQ boxes in Google, more visibility without extra content.

Ready-to-use prompt template

"Analyze the [niche] for SEO. Identify top keywords, topic clusters, competitor gaps and search intent. Then write a 2,000-word EAT-optimized article on [topic]. Include real tool examples, case studies, author bio, and structured data."

Plan to try this for the ServiceOP client

- Run the keyword + topic cluster prompt on the client's niche/city first — use it as the base content plan.

- Write the pillar page first, then 2–3 supporting articles that link back to it.
- Once the client has Search Console access set up, feed that data back to Claude monthly to fix stuck pages — this becomes the "technical SEO / rank monitoring" line item in the contract.
- For every new location Abraham's client adds, generate one local page with this same process instead of writing from scratch.
